# Mathematical Tools <br> for Engineering and Management 

Lecture 13

25 Jan 2012
$\left(\frac{\text { GPE }}{(G)}\right)$
$\triangleright$ Models, Data and Algorithms
$\triangleright$ Linear Optimization
$\triangleright$ Mathematical Background: Polyhedra, Simplex-Algorithm
$\triangleright$ Sensitivity Analysis; (Mixed) Integer Programming
$\triangleright$ MIP Modelling
$\triangleright$ MIP Modelling: More Examples; Branch \& Bound
$\triangleright$ Cutting Planes; Combinatorial Optimization: Examples, Graphs, Algorithms
$\triangleright$ TSP-Heuristics
$\triangleright$ Network Flows
$\triangleright$ Shortest Path Problem
$\triangleright$ Complexity Theory
$\triangleright$ Nonlinear Optimization
$\triangleright$ Scheduling
$\triangleright$ Lot Sizing \& Intro to Multiobjective Optimization (Feb 01)
$\triangleright$ Summary (Feb 08)
$\triangleright$ Oral exam (Feb 15)

Printing machine

Printing machine Jobs

Printing machine

Jobs

Job 1: Book
200 pages, 500 copies 3 h printing time

Job 2: Book 60 pages, 2500 copies 4h printing time

Job 3: Thesis
170 pages, 10 copies 1 h printing time

## Jobs

Job 1: Book
200 pages, 500 copies 3h printing time

Job 2: Book 60 pages, 2500 copies 4h printing time

Job 3: Thesis
170 pages, 10 copies 1h printing time

- Determine an optimal order for the jobs to be processed...

## Jobs

Job 1: Book
200 pages, 500 copies 3h printing time

Job 2: Book 60 pages, 2500 copies 4h printing time

Job 3: Thesis
170 pages, 10 copies 1h printing time

- Determine an optimal order for the jobs to be processed...
$\Rightarrow$...if jobs have to be finished at a given time

Jobs

Job 1: Book
200 pages, 500 copies 3h printing time

Job 2: Book 60 pages, 2500 copies 4h printing time

Job 3: Thesis
170 pages, 10 copies 1h printing time
$\triangleright$ Determine an optimal order for the jobs to be processed...

- ...if jobs have to be finished at a given time
$\Rightarrow$...if some jobs are more important than others

Jobs

Job 1: Book
200 pages, 500 copies 3h printing time

Job 2: Book 60 pages, 2500 copies 4h printing time

Job 3: Thesis
170 pages, 10 copies
1h printing time
$\triangleright$ Determine an optimal order for the jobs to be processed...
$\Rightarrow$...if jobs have to be finished at a given time
$\Rightarrow$...if some jobs are more important than others
$\Rightarrow$...if there is more than one machine (identical or different machines)

$\triangleright$ Supercomputing at ZIB

## 九゙டアп <br> Norddeutscher Verbund für Hoch－und Höchstleistungsrechnen

 $7 \angle \sqrt{D}$
$\triangleright$ Supercomputing at ZIB

## Аіடア <br> Norddeutscher Verbund für Hoch- und Höchstleistungsrechnen

- $\quad \sim 1500$ compute nodes with $\sim 13000$ cores
$\triangleright$ Supercomputing at ZIB

$\triangleright \quad \sim 1500$ compute nodes with $\sim 13000$ cores
$\triangleright$ Schedule computation jobs...
...consisting of thousands of parallel processes
...according to their release times
(GPE)
$\triangleright$ Jobs:

$\left(\frac{\mathrm{CPE}}{(\mathrm{GPE}}\right):$
7S\|
$\triangleright$ Jobs:

$\triangleright$ Schedule (Gantt chart):
$\qquad$
7 $\mathrm{Cl} \|$
$\triangleright$ Jobs:
$\square$

$\triangleright$ Schedule (Gantt chart):

Machine

$\left(\frac{7 P}{G P E}\right):$
$\triangleright$ Jobs:

$\triangleright$ Schedule (Gantt chart):
$\Rightarrow$ optimal with respect to an objective to specify!

$\triangleright$ Jobs usually have: a processing time $p_{j}$

E $\qquad$
$\triangleright$ Jobs usually have: a processing time $p_{j}$

$\qquad$
$\mathrm{ZQ} \mathrm{D}_{\mathrm{B}}$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$

$\left(\begin{array}{l}(\mathrm{GPE}) \\ (2)\end{array}\right.$ $\qquad$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$

$\left(\frac{\text { GPE }}{(G)}\right.$ $\qquad$

$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap

$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right)$ $\qquad$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap

$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right)$ $\qquad$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap

$\square$

Output $\Rightarrow s_{j}$
$s_{k}$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap

- Combinatorial optimization problem

E $\qquad$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap
$\Rightarrow$ Combinatorial optimization problem $\Rightarrow$ IP formulations for most scheduling problems

E $\qquad$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap
$\Rightarrow$ Combinatorial optimization problem $\boldsymbol{\Rightarrow}$ IP formulations for most scheduling problems
$\Rightarrow$ Completion time $C_{j}:=s_{j}+p_{j}$

$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap
$\Rightarrow$ Combinatorial optimization problem $\Rightarrow$ IP formulations for most scheduling problems
$\Rightarrow$ Completion time $C_{j}:=s_{j}+p_{j}$

( ${ }^{(P P)}$ $\qquad$
$\triangleright$ Jobs usually have: a processing time $p_{j}$
$\triangleright$ A schedule has to provide: a start time $s_{j}$, such that different jobs do not overlap
$\Rightarrow$ Combinatorial optimization problem $\Rightarrow$ IP formulations for most scheduling problems
$\Rightarrow$ Completion time $C_{j}:=s_{j}+p_{j}$
$\Rightarrow$ Average completion time for $n$ jobs: $\frac{1}{n} \sum_{j=1}^{n} C_{j}$

$\qquad$
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right):$ $\qquad$
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\triangleright$ Example schedule:
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\triangleright$ Example schedule:

| 16 |  | 10 |  | 6 | 22 |  | 12 |  | 14 |  | 15 |  | 20 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | 16 |  | 26 | 32 |  | 54 |  | 66 |  | 80 |  | 95 |  | 115 | 129 |

(GPE) $\qquad$
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\triangleright$ Example schedule:

$\qquad$
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\triangleright$ Example schedule:

$\qquad$
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\triangleright$ Example schedule:

$\Rightarrow$ Idea: Schedule jobs in order of non-decreasing processing time!
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\triangleright$ Example schedule:
Machine

| 16 | 10 | 6 | 12 | 22 | 14 | 15 |  | 20 | 14 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\Rightarrow \sum_{j=1}^{n} C_{j}=16+26+32+44+66+80+95+115+129=603$

- Idea: Schedule jobs in order of non-decreasing processing time!

| 6 | 10 | 12 | 14 | 14 | 15 | 16 | 20 | 22 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\Rightarrow \sum_{j=1}^{n} C_{j}=6+16+28+42+56+71+87+107+129=542$
GPE
$\triangleright$ For fixed number $n$ of jobs: minimize sum of completion times $\sum_{j=1}^{n} C_{j}$
$\triangleright$ Example schedule:

Machine

|  | 16 |  | 10 |  | 6 | 12 |  | 22 |  | 14 |  | 15 |  | 20 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\uparrow$ |  | $\uparrow$ |  | $\uparrow$ |  |  | $\uparrow$ |  | $\uparrow$ |  | $\uparrow$ |  | $\uparrow$ |  | $\uparrow$ | $\uparrow$ |
| 0 |  | 16 |  | 26 | 32 |  | 44 |  | 66 |  | 80 |  | 95 |  | 115 | 129 |

$\Rightarrow \sum_{j=1}^{n} C_{j}=16+26+32+44+66+80+95+115+129=603$
$\Rightarrow$ Idea: Schedule jobs in order of non-decreasing processing time!

- provably optimal!

Machine

| 6 | 10 | 12 | 14 | 14 | 15 | 16 | 20 | 22 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\Rightarrow \sum_{j=1}^{n} C_{j}=6+16+28+42+56+71+87+107+129=542$
$\left(\frac{\text { GPE }}{(G)}\right)$
$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right):$ $\qquad$
$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\triangleright$ Example schedule:

| Machine16 10 6 22 12 14 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\qquad$
$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\triangleright$ Example schedule:

$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right):$ $\qquad$
$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\triangleright$ Example schedule:

- makespan: 129
$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\triangleright$ Example schedule:

$\Rightarrow$ makespan: 129
$\left(\frac{(\mathrm{TPE}}{(\mathrm{GP})}\right.$ $\qquad$
$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\triangleright$ Example schedule:

$\Rightarrow$ makespan: 129
$\Rightarrow$ Any schedule (without idle times) gives the same makespan!
$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\triangleright$ Example schedule:

Machine

| 16 | 10 | 6 | 12 | 22 | 14 | 15 | 20 | 14 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

- makespan: 129
$\Rightarrow$ Any schedule (without idle times) gives the same makespan!
Obvious, since the makespan

$$
\max _{j=1, \ldots, n} C_{j}=\sum_{j=1}^{n} p_{j}
$$

$\triangleright$ Latest completion time $\Rightarrow$ minimize makespan $\max _{j=1, \ldots, n} C_{j}$
$\triangleright$ Example schedule:

Machine

| 16 | 10 | 6 | 12 | 22 | 14 | 15 | 20 | 14 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

- makespan: 129
$\Rightarrow$ Any schedule (without idle times) gives the same makespan!
Obvious, since the makespan

$$
\max _{j=1, \ldots, n} C_{j}=\sum_{j=1}^{n} p_{j}
$$

depends only on the input (processing times), not on the schedule itself
$\triangleright$ Jobs can have: a release date $r_{j}$

E
,
Z
$\triangleright$ Jobs can have: a release date $r_{j}$

E $\qquad$

$7 \angle \sqrt{8}$
$\triangleright$ Jobs can have: a release date $r_{j}$

$\Rightarrow$ Start time of job $j$ cannot be before its release date
$\qquad$
$\triangleright$ Jobs can have: a release date $r_{j}$

$\Rightarrow$ Start time of job $j$ cannot be before its release date

(GPE) $\qquad$

ZZID
$\triangleright$ Jobs can have: a release date $r_{j}$

$\Rightarrow$ Start time of job $j$ cannot be before its release date

$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right):$ $\qquad$

Z 2 [D
$\triangleright$ Jobs can have: a release date $r_{j}$

$\Rightarrow$ Start time of job $j$ cannot be before its release date

## job $j$

(GPE) $\qquad$
$\triangleright$ Jobs can have: a release date $r_{j}$

$\Rightarrow$ Start time of job $j$ cannot be before its release date

- Constraint: $s_{j} \geq r_{j}$

## job $j$

- Input now: jobs with release dates

$\left(\frac{T}{(G P E}\right):$ $\qquad$
- Input now: jobs with release dates

$\triangleright$ Minimize makespan
( CPE $\qquad$

- Input now: jobs with release dates

$\triangleright$ Minimize makespan
$\Rightarrow$ Optimal algorithm: schedule jobs in the order of non-decreasing release dates
$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right)$ $\qquad$
- Input now: jobs with release dates

$\triangleright$ Minimize makespan
$\Rightarrow$ Optimal algorithm: schedule jobs in the order of non-decreasing release dates

- Jobs can...
- ...have weights (priorities)
(GPE) $\qquad$

Z 2 [D

- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times: same as in the unweighted case

GPE $\qquad$
$\triangleright$ Jobs can...

- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)

E $\qquad$

- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)
$\Rightarrow$ minimize maximum lateness: schedule jobs in order of non-decreasing due dates

GPE $\qquad$

- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)
$\Rightarrow$ minimize maximum lateness: schedule jobs in order of non-decreasing due dates
- ...have both due dates and release dates
- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)
$\Rightarrow$ minimize maximum lateness: schedule jobs in order of non-decreasing due dates
- ...have both due dates and release dates
$\Rightarrow$ more complicated ( $\mathcal{N} \mathcal{P}$-hard)
- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)
$\Rightarrow$ minimize maximum lateness: schedule jobs in order of non-decreasing due dates
- ...have both due dates and release dates
$\Rightarrow$ more complicated ( $\mathcal{N} \mathcal{P}$-hard)
- ...be allowed to be interrupted (possibly at additional cost/time)
- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)
$\Rightarrow$ minimize maximum lateness: schedule jobs in order of non-decreasing due dates
- ...have both due dates and release dates
$\Rightarrow$ more complicated ( $\mathcal{N} \mathcal{P}$-hard)
- ...be allowed to be interrupted (possibly at additional cost/time)
$\Rightarrow$ easier if no cost/time involved, harder otherwise
- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)
$\Rightarrow$ minimize maximum lateness: schedule jobs in order of non-decreasing due dates
- ...have both due dates and release dates
$\Rightarrow$ more complicated ( $\mathcal{N} \mathcal{P}$-hard)
- ...be allowed to be interrupted (possibly at additional cost/time)
$\Rightarrow$ easier if no cost/time involved, harder otherwise
- ...consume resources
- Jobs can...
- ...have weights (priorities)
$\Rightarrow$ minimize weighted sum of completion times : same as in the unweighted case
- ...have due dates (preferred latest completion time)
$\Rightarrow$ minimize maximum lateness: schedule jobs in order of non-decreasing due dates
- ...have both due dates and release dates
$\Rightarrow$ more complicated ( $\mathcal{N} \mathcal{P}$-hard)
- ...be allowed to be interrupted (possibly at additional cost/time)
$\Rightarrow$ easier if no cost/time involved, harder otherwise
- ...consume resources
$\Rightarrow$ Resource-constrained scheduling
$\triangleright \quad$ Single Machine Scheduling: only one machine available
$\qquad$
$\qquad$
$\triangleright \quad$ Single Machine Scheduling: only one machine available
$\Rightarrow$ Minimal latest completion time is constant
$\qquad$
$\qquad$
$\triangleright \quad$ Single Machine Scheduling: only one machine available
$\Rightarrow$ Minimal latest completion time is constant
$\Rightarrow$ With no release dates, greedy strategy gives an optimal solution

GPE $\qquad$
$\qquad$
$\triangleright$ Single Machine Scheduling: only one machine available
$\Rightarrow$ Minimal latest completion time is constant
$\Rightarrow$ With no release dates, greedy strategy gives an optimal solution

- With release dates, greedy strategy only works for makespan minimization
$\qquad$ ............
$\triangleright$ Single Machine Scheduling: only one machine available
$\Rightarrow$ Minimal latest completion time is constant
$\Rightarrow$ With no release dates, greedy strategy gives an optimal solution
- With release dates, greedy strategy only works for makespan minimization
$\triangleright$ Summary if no interruptions and resources are involved:

|  | Objective |  |  |
| :--- | :--- | :--- | :--- |
| no release dates | non-decreasing <br> process times | trivial | lateness |
| with release dates | $\mathcal{N} \mathcal{P}$-hard | non-decreasing <br> release dates | non-decreasing <br> due dates |
|  |  |  |  |

$\triangleright$ Example:

| job $j$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| process time $p_{j}$ | 5 | 6 | 9 | 12 | 7 | 12 | 10 | 6 | 10 | 9 | 7 | 8 | 7 | 5 |

$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right):$
$\triangleright$ Example:

| job $j$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\triangleright$ Jobs can be carried out on one of 3 identical machines

10
$\square$
$\left(\frac{19}{(G P E}\right):$
$\triangleright$ Jobs can be carried out on one of 3 identical machines

$\triangleright$ Minimize sum of completion times
$\qquad$
$\triangleright$ Jobs can be carried out on one of 3 identical machines

$\triangleright$ Minimize sum of completion times

$\qquad$
$\qquad$
$\triangleright$ Jobs can be carried out on one of 3 identical machines

$\triangleright$ Minimize sum of completion times

$\triangleright$ Jobs can be carried out on one of 3 identical machines

$\triangleright$ Minimize sum of completion times

$$
\begin{aligned}
\sum_{j=1}^{n} C_{j} & =6+20+36 \\
& =10+24+44 \\
& =12+28+50 \\
& =230
\end{aligned}
$$

$\Rightarrow$ Optimal: schedule by non-decreasing processing times, on earliest available machine
$\triangleright$ Minimize sum of completion times: polynomial (greedy algorithm)
$\triangleright$ Minimize sum of completion times: polynomial (greedy algorithm)
$\triangleright \quad$ Minimize makespan: $\mathcal{N} \mathcal{P}$-hard

GPE $\qquad$
$\qquad$
$\triangleright$ Minimize sum of completion times: polynomial (greedy algorithm)
$\triangleright$ Minimize makespan: $\mathcal{N} \mathcal{P}$-hard

- Variants: types of machines
- Identical machines

E $\qquad$
$\triangleright$ Minimize sum of completion times: polynomial (greedy algorithm)
$\triangleright$ Minimize makespan: $\mathcal{N} \mathcal{P}$-hard

- Variants: types of machines
- Identical machines
- Uniform machines: machines differ by a fixed speed factor
$\triangleright$ Minimize sum of completion times: polynomial (greedy algorithm)
$\triangleright$ Minimize makespan: $\mathcal{N} \mathcal{P}$-hard
- Variants: types of machines
- Identical machines
- Uniform machines: machines differ by a fixed speed factor
- Unrelated machines: processing times differ for every job on each machine
$\left(\frac{\mathrm{FPE}}{(\mathrm{GPE}}\right):$ $\qquad$
$\qquad$
$\triangleright$ Minimize sum of completion times: polynomial (greedy algorithm)
$\triangleright \quad$ Minimize makespan: $\mathcal{N} \mathcal{P}$-hard
- Variants: types of machines
- Identical machines
- Uniform machines: machines differ by a fixed speed factor
- Unrelated machines: processing times differ for every job on each machine
$\triangleright$ All the other additional features: weights, release dates, precedence constraints, ...
(GPE) $\qquad$
$\qquad$
